

THE CNLTX BUNDLE

Documentation for L^AT_EX 2_ε Packages or Classes

v0.3 2013/09/12

L^AT_EX examples the CN way

Clemens NIEDERBERGER

<https://github.com/cgnieder/cnltx>

contact@mychemistry.eu

A bundle of packages and classes for consistent format of control sequences, package options, source code with examples, writing a package manual (including an index containing the explained control sequences, options, ...).

Table of Contents

Part I.

About The Bundle

1. Background

The **CNLTX** bundle contains different packages and classes. I developed it as a successor of my class `cnpkgdoc` that I used for writing the documentation of my packages. The intention behind this is a cleaner interface and less unnecessary ballast, hence the separation into packages and classes. The bundle provides source code environments that also print the output and defines quite a number of macros for formatting of control sequence names, package names, package options and so on.

Part of the motivation is also that users have asked me how I created the manuals for my packages. Now I can refer to this bundle.

Another reason for the splitting into separate packages is – besides the advantage of easier maintenance – is that I may want to add programming tools that I use often into **CNLTX-BASE** which may allow me (and others) to use them for other packages, too, without having to define them each time. So it is quite possible that **CNLTX-BASE** will get extended in the future.

The best documentation for the bundle as always is the source code of the `sty` and `cls` files but I'm trying to provide a documentation as comprehensive as possible. This is one of the reasons why this documentation is noticeably longer than the one for `cnpkgdoc`.

The bundle reflects the fact that I haven't started using literate programming, yet. I don't use `docstrip` and don't write `dtx` files but always write the `sty` or `cls` files directly. The manual is always created parallel but separately. While I'm entirely aware of the advantages of literate programming I never could bring myself to start to use it myself. As a consequence I have no idea if this bundle can be used for it or not.

2. Bundled Packages and Classes

Source code formatting is done with the help of the powerful listings package by Carsten Heinz and later Brooks Moses, now maintained by Jobst Hoffmann. The only real drawback I have found with it is recognizing starred and un-starred versions of an environment as different keywords. This does not seem to be possible which is why indexing of such environments will lead to wrong page numbers.

The fancy frames of the source code examples are realized with the mdframed package by Marco Daniel, loaded with the option `framemethod = tikz`.

2. Bundled Packages and Classes

The **CNLTX** bundle currently bundles the following packages and classes:

- **CNLTX-BASE** – a package that defines base macros for error-messaging, expansion control and tokenlist manipulation. It also provides color definitions and defines a few color schemes for the **CNLTX-DOC** class. All other packages and classes of the **CNLTX** bundle load this package.

This package can be loaded alone.

- **CNLTX-EXAMPLE** – a package that defines macros and environments for describing control sequences and options and for including source code.

This package can be loaded alone.

- **CNLTX-CSNAMES** – a package that defines a list of highlighted control sequence names, loaded by **CNLTX-EXAMPLE**.

It does not make sense to load this package directly: it only defines a single macro containing the list of control sequence names. The package only exists for maintenance reasons.

The list is by no means comprehensive. If you like to extend it feel free to fork the github repo (<https://github.com/cgnieder/cnltx>). That would be very much appreciated.

- **CNLTX-TOOLS** – a package that defines tools used by **CNLTX-DOC** that are unrelated to \LaTeX documentation *per se*.
- **CNLTX-DOC** – a class for writing package manuals. Loads **CNLTX-EXAMPLE** and **CNLTX-TOOLS**.
- `cnltx.ist` – an index style file that is used when the option `add-index` is activated and the option `index-style` is not used.

3. License and Requirements

Permission is granted to copy, distribute and/or modify this software under the terms of the \LaTeX Project Public License (LPPL), version 1.3 or later (<http://www.latex-project.org/lppl.txt>). The software has the status “maintained.”

The **CNLTX-BASE** package loads the following packages: **pgfopts**,¹ **etoolbox**,² **trimspaces**³ and **xcolor**.⁴

The **CNLTX-CSNAMES** package only loads **CNLTX-BASE**.

The **CNLTX-EXAMPLE** package loads the following packages: **CNLTX-BASE**, **CNLTX-TOOLS**, **translations**,⁵ **listings**,⁶ **mdframed**⁷ and **idxcmds**.⁸

The **CNLTX-TOOLS** package loads **CNLTX-BASE** and **accsupp**.⁹

The **CNLTX-DOC** class loads the package with the same name and additionally the following packages: **CNLTX-BASE**, **CNLTX-EXAMPLE**, **translations**, **ulem**,¹⁰ **multicol**,¹¹ **ragged2e**,¹² **marginnote**¹³ and **hyperref**.¹⁴ It is a wrapper class for the KOMA-Script class **scrartcl**.¹⁵

Like all of my packages **CNLTX** implicitly relies on an up to date **T_EX** distribution.

Part II.

Details of Available Commands, Environments and Options

4. Options and Setup

The **CNLTX** bundle has a number of options. The **CNLTX-DOC** class only knows a few options (described in section 9.1 on page 18) as *class* options. All other options regardless if they're defined by a package or a class can and should be set with the **setup** command:

```
\setcnltx{<options>}  
setup command for CNLTX.
```

The source code environments defined by the **CNLTX-EXAMPLE** package also have optional arguments that can be used to set the options for the environment locally.

 15. on CTAN as **koma-script**: <http://mirrors.ctan.org/macros/latex/contrib/koma-script/>

5. Available Commands

5.1. Description of Macros, Environments and Options

provided by the
CNLTX-EXAMPLE
package

The commands described in this section all are provided by the **CNLT**X package. They all are related to the typesetting of provided macros, options and the like.

\code{*arg*}

Formatting of source code. This is *no* verbatim command. Used internally in the following commands.

\verbcode{*delim*}{*code*}{*delim*}

Introduced in
version 0.2

A verbatim command that uses the same formatting as the source code example environments. This is a wrapper for **\lstinline** which loads the corresponding style.

\cs*{*name*}

Format the control sequence *name*, **\cs**{*name*}: **\name**. Adds a corresponding index entry. The starred form does not add an index entry.

\csidx{*name*}

Adds an index entry but does not typeset the control sequence *name*.

\env*{*name*}

Format the environment *name*, **\env**{*name*}: *name*. Adds a corresponding index entry with a hint that the entry refers to an environment. The starred form does not add an index entry.

\envidx{*name*}

Adds an index entry but does not typeset the environment *name*.

\meta{*meta*}

Description of an argument, **\meta**{*meta*}: *meta*.

\marg{*arg*}

A mandatory argument. *arg* is formatted with **\meta** if it is not blank, **\marg**{*arg*}: {*arg*}.

\Marg{*arg*}

Introduced in
version 0.2

A mandatory argument. *arg* is formatted with **\code** if it is not blank, **\Marg**{*arg*}: {*arg*}.

\oarg{*arg*}

An optional argument. *arg* is formatted with **\meta** if it is not blank, **\oarg**{*arg*}: [*arg*].

\Oarg{*arg*}

Introduced in
version 0.2

An optional argument. *arg* is formatted with **\code** if it is not blank, **\Oarg**{*arg*}: [*arg*].

\darg{*arg*}

An argument with parentheses as delimiters. *arg* is formatted with **\meta** if it is not blank, **\darg**{*arg*}: (*arg*).

5. Available Commands

Introduced in
version 0.2

`\Darg{⟨arg⟩}`

An argument with parentheses as delimiters. `⟨arg⟩` is formatted with `\code` if it is not blank, `\Darg{arg}`: (arg).

`\sarg`

An optional star argument, `\sarg`: *.

`\option*{⟨name⟩}`

An option `⟨name⟩`, `\option{name}`: name. Adds a corresponding index entry. The starred form does not add an index entry.

`\optionidx{⟨name⟩}`

Adds an index entry but does not typeset the option `⟨name⟩`.

`\module*{⟨name⟩}`

A module `⟨name⟩`, `\module{name}`: name. Adds a corresponding index entry. The starred form does not add an index entry. In some of my package I like to organize options by grouping them in different classes that I call “modules”. This command refers to those modules.

`\moduleidx*{⟨name⟩}`

Adds an index entry but does not typeset the option `⟨name⟩`.

`\key*-{⟨name⟩}{⟨value⟩}`

A key `⟨name⟩` with value `⟨value⟩`, the optional star prevents an index entry, the optional - strips the braces around `⟨value⟩`; `\key{key}{value}`: key = {⟨value⟩}; `\key-{key}{value}`: key = `⟨value⟩`

Introduced in
version 0.2

`\keyis*{⟨name⟩}{⟨value⟩}`

A key `⟨name⟩` set to value `⟨value⟩`, the optional star prevents an index entry, `\key{keyis}{value}`: key = value.

`\choices{⟨clist of choices⟩}`

A list of choices, `\choices{one,two,three}`: one|two|three

`\choicekey{⟨name⟩}{⟨clist of choices⟩}`

A key `⟨name⟩` with a list of possible values, `\choicekey{key}{one,two,three}`: key = one|two|three

`\boolkey{⟨name⟩}`

A boolean key `⟨name⟩` with choices true and false, `\boolkey{key}`: key = true|false

`\default{⟨value⟩}`

Markup for a default choice, `\choices{one,\default{two},three}`: one|two|three

5.2. Versioning Commands, Licensing and Related Stuff

provided by the
CNLTX-DOC class

The commands described in this section are provided by the `CNLTX` class except where indicated differently. These commands are related to information about the legal stuff of a package and where to find it on the world wide web.

5. Available Commands

Introduced in version 0.0	<code>\sinceversion{<version>}</code>	Gives a sidenote like the one on the left.
Changed in version 0.0	<code>\changedversion{<version>}</code>	Gives a sidenote like the one on the left.
	<code>\newnote*{<cs>}[<num>]{<definition>}</code>	Defines a note like <code>\sinceversion</code> . The star makes the note macro short, <code><num></code> defines the number of mandatory arguments. Optional arguments are not possible. <code>\sinceversion</code> was defined as follows: <code>\newnote*\sinceversion[1]{Introduced in version~#1}</code>
	<code>\newpackagename{<cs>}{<name>}</code>	Define a comand <code><cs></code> that prints <code><name></code> formatted like <code>CNLTx</code> .
provided by the <code>CNLTx-TOOLS</code> package	<code>\newname{<cs>}{<first name>}{<second name>}</code>	Defines <code><cs></code> to write out the full name and add an index entry sorted by the last name. Also defines a starred variant of <code><cs></code> that only writes the last name but still adds the full index entry.
	<code>\lppl</code>	Typesets “LPPL” and adds a corresponding index entry.
	<code>\LPPL</code>	Typesets “L ^A T _E X Project Public License” and adds a the same index entry as <code>\lppl</code> .
Changed in version 0.2	<code>\license*[<maintenance status>]</code>	Default: maintained Typesets ‘Permission is granted to copy, distribute and/or modify this software under the terms of the L ^A T _E X Project Public License (LPPL), version 1.3 or later (http://www.latex-project.org/lppl.txt). The software has the status “maintained.”. The un-starred variant adds a <code>\par</code> .
	<code>\ctan</code>	Typesets “CTAN” and adds a corresponding index entry.
	<code>\CTAN</code>	Typesets “Comprehensive T _E X Archive Network” and adds the same index entry as <code>\ctan</code> .
provided by the <code>CNLTx-TOOLS</code> package	<code>\cnltxacronym{<pdf and sort string>}{<acronym>}</code>	Typesets <code><acronym></code> with small caps and uses <code><pdf and sort string></code> as PDF string and for sorting the index entry that is added. This command was used to define <code>\lppl</code> and <code>\ctan</code> . <i>This is not intended as a replacement for packages like <code>acro</code> or <code>glossaries</code>!</i> In fact it is a “poor man’s” solution that allows me not to require one of those packages.
provided by the <code>CNLTx-EXAMPLE</code> package	<code>\pkg*{<package>}</code>	Format the package name <code><package></code> and add an index entry. The starred variant adds nothing to the index.
provided by the <code>CNLTx-EXAMPLE</code> package	<code>\pkgidx{<package>}</code>	Add an index entry for the package <code><package></code> .

5. Available Commands

`\cls*{<class>}`

provided by the **CNLT**X-EXAMPLE package Format the class name `<class>` and add an index entry. The starred variant adds nothing to the index.

`\clsidx{<class>}`

provided by the **CNLT**X-EXAMPLE package Add an index entry for the class `<class>`.

`\CTANurl[<directory>]{<name>}`

Writes a CTAN link like the ones in section 3 on page 3 in the footnotes. The predefined directory is `macros/latex/contrib`. The link address will be:

`http://mirrors.ctan.org/<directory>/<name>/`.

`\needpackage[<directory>]{<name>}`

Introduced in version 0.2 A wrapper for `\pkg{#2}\footnote{\CTANurl[#1]{#2}}`

`\needclass[<directory>]{<name>}`

Introduced in version 0.2 A wrapper for `\cls{#2}\footnote{\CTANurl[#1]{#2}}`

```
1 \newpackagename{\foothree}{foo-3}%
2 now \foothree\ looks like \cnltx.
3
4 \newname\carlisle{David}{Carlisle}%
5 \carlisle\ is a well-known member of the \LaTeX\ community. \carlisle* is
6 the author of many packages such as \pkg{*longtable}.
```

now **FOO-3** looks like **CNLT**X.

David Carlisle is a well-known member of the \LaTeX community. Carlisle is the author of many packages such as `longtable`.

5.3. Input Source Code Files

Similar to the environments described in section 6.2 on the following page **CNLT**X-EXAMPLE provides a few commands for inputting source code files, formatting and printing the source code and inputting the file directly.

`\inputexample[<options>]{<file name>}`

The equivalent of the `example` environment, see section 6.2 on the next page.

`\inputsidebyside[<options>]{<file name>}`

The equivalent of the `sidebyside` environment, see section 6.2 on the following page.

`\inputsourcecode[<options>]{<file name>}`

The equivalent of the `sourcecode` environment, see section 6.2 on the next page.

It is possible to define further commands like this:

`\newinputsourcefilecmd[<option>]{<control sequence>}`

Defines *<control sequence>* as a new source code input command where *<options>* are preset.

The existing commands have been defined like this:

```
1 \newinputsourcefilecmd\inputexample
2 \newinputsourcefilecmd[side-by-side]\inputsidebyside
3 \newinputsourcefilecmd[code-only]\inputsourcecode
```

6. Available Environments

6.1. Description Environments

CNLTX-DOC defines some description environments used to describe macros, environments or options.

`\begin{commands}`

A description-like environment for describing commands. While this environment is a list internally and thus recognizes `\item` own commands are used to describe macros. They are explained in section 7.1 on the following page.

`\begin{options}`

A description-like environment for describing options. While this environment is a list internally and thus recognizes `\item` own commands are used to describe options. They are explained in section 7.2 on page 11.

`\begin{environments}`

A description-like environment for describing environments. While this environment is a list internally and thus recognizes `\item` own commands are used to describe environments. They are explained in section 7.3 on page 14.

These environments are lists all using the same internal `\list`. The setup of this list can be changed via an option:

`\list-setup = {<definitions>}`

Default: `\leftmargin=0pt \labelwidth=2em \labelsep=0pt \itemindent=-1em`

The setup of the `\list` used by the commands, options and environments environments.

6.2. Source code Environments

CNLTX-EXAMPLE defines the following environments that are used to display source code and possibly the output of the source code, too.

7. Usage

`\begin{example}[\langle options \rangle]`

This environment is a formatted verbatim environment that also inputs the output of the inputted code. This environment is described in section 7.4 on page 14.

`\begin{sidebyside}[\langle options \rangle]`

This environment is a formatted verbatim environment that also inputs the output of the inputted code. Source and output are printed side-by-side. This environment is described in section 7.4 on page 14.

`\begin{sourcecode}[\langle options \rangle]`

This environment is a formatted verbatim environment. This environment is described in section 7.4 on page 14.

Introduced in
version 0.2

In each of these environments certain hooks are provided that can be used to add definitions you like:

`pre-code = {\langle definitions \rangle}`

`\langle definitions \rangle` are placed before the source code is inserted.

`after-code = {\langle definitions \rangle}`

`\langle definitions \rangle` are placed after the source code is inserted.

`pre-source = {\langle definitions \rangle}`

`\langle definitions \rangle` are placed before the output of the source code is inserted.

`after-source = {\langle definitions \rangle}`

`\langle definitions \rangle` are placed after the output of the source code is inserted.

It is possible to define further environments like this:

`\newsourcecodeenv[\langle option \rangle]{\langle name \rangle}`

Defines `\langle name \rangle` as a new source code environment where `\langle options \rangle` are preset.

The existing environments have been defined like this:

```
1 \newsourcecodeenv{example}
2 \newsourcecodeenv[side-by-side]{sidebyside}
3 \newsourcecodeenv[code-only]{sourcecode}
```

7. Usage

7.1. Command Descriptions

Inside of the environment commands that was introduced in section 6.1 on the preceding page items are input via the following command:

`\command*{⟨name⟩}[⟨stuff after⟩]`

This macro formats a control sequence with `\cs` and puts a line break after it. The optional argument allows printing things directly after the command name and can thus be used for adding arguments.

`\Default*!{⟨code⟩}`

This command can be placed after `\command` or `\option` in order to give a default definition of a macro or a default value of an option. The definition will then be placed on the same line flush right. The star prevents the insertion of `\newline` after it. The optional bang adds the information that an option is mandatory, *i.e.*, it has to be set.

Changed in
version 0.3

```

1 \begin{commands}
2   \command{cs}
3   This is about foo bar baz.
4   \command{cs}[\margin{arg}]
5   This one has an argument.
6   \command{cs}[\sarg\oarg{option}]
7   This has a star variant and an optional argument.
8   \command{cs}\Default{foo bar}
9   This one has the default replacement text \code{foo bar}
10 \end{commands}

```

`\cs`

This is about foo bar baz.

`\cs{⟨arg⟩}`

This one has an argument.

`\cs*[⟨option⟩]`

This has a star variant and an optional argument.

`\cs`

This one has the default replacement text foo bar

Default: foo bar

7.2. Option Descriptions

The options environment knows a few more commands to meet all the different kinds of options.

`\opt*`

An option. The star prevents an index entry.

7. Usage

`\keyval*-{⟨key⟩}{⟨value⟩}`

A key/value option. The optional star prevents an index entry. The optional - strips the braces around `⟨value⟩`, see the example below.

`\keychoice*{⟨key⟩}{⟨list of choices⟩}`

A key/value option where the value is one of a list of choices. The star prevents an index entry.

`\keybool*{⟨name⟩}`

A boolean key, that is a choice key with choices true and false. The star prevents an index entry.

`\Default*!{⟨code⟩}`

This command can be placed after `\command` or `\option` in order to give a default definition of a macro or a default value of an option. The definition will then be placed on the same line flush right. The star prevents the insertion of `\newline` after it. The optional bang adds the information that an option is mandatory, *i.e.*, it has to be set.

Changed in
version 0.3

`\Module*!{⟨name⟩}`

This command can be placed after `\option` but before `\Default` in order to determine the module the option belongs to. It will be written in the left margin next to the option name. The star prevents the insertion of `\newline` after it. The optional bang *adds* an index entry for the module. This is somehow inconsistent with many of the other commands where an optional star *prevents* an index entry but it fits to the functionality of `\Default` which is why this syntax was chosen.

Introduced in
version 0.3

The following demonstrates how the commands would be used to create option descriptions:

```
1 \begin{options}
2   \opt{foo}
3     This makes stuff. Let's add a few more words so that the line gets
4     filled and we can see how the output actually looks.
5   \opt*{foo}\Default{bar}
6     This makes stuff. Let's add a few more words so that the line gets
7     filled and we can see how the output actually looks.
8   \opt{foo}\Module{bar}
9     This option belongs to \module*{bar}. Let's add a few more words so
10    that the line gets filled and we can see how the output actually
11    looks.
12  \opt{foo}\Module{bar}\Default{baz}
13    This option belongs to \module*{bar}. Let's add a few more words so
14    that the line gets filled and we can see how the output actually
15    looks.
16  \keyval{foo}{bar}\Default
17    This makes stuff. Let's add a few more words so that the line gets
18    filled and we can see how the output actually looks.
19  \keyval{foo}{bar}\Default!
```

7. Usage

```
20 This makes stuff. Let's add a few more words so that the line gets
21 filled and we can see how the output actually looks.
22 \keyval*{foo}{bar}
23 This makes stuff. Let's add a few more words so that the line gets
24 filled and we can see how the output actually looks.
25 \keyval-{foo}{bar}
26 This makes stuff. Let's add a few more words so that the line gets
27 filled and we can see how the output actually looks.
28 \keychoice{foo}{one,two,three}
29 This makes stuff. Let's add a few more words so that the line gets
30 filled and we can see how the output actually looks.
31 \keybool{foo}
32 This makes stuff. Let's add a few more words so that the line gets
33 filled and we can see how the output actually looks.
34 \end{options}
```

The code above gives the following output:

foo

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

foo

Default: bar

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

bar » foo

This option belongs to the module **bar**. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

bar » foo

Default: baz

This option belongs to the module **bar**. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

foo = {*bar*}

(initially empty)

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

foo = {*bar*}

(required)

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

foo = *bar*

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

foo = *bar*

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

`foo = one|two|three`

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

`foo = true|false`

This makes stuff. Let's add a few more words so that the line gets filled and we can see how the output actually looks.

7.3. Environment Descriptions

Environment descriptions are made – unsurprisingly – with the `environments` environment. It knows the command `\environment`:

`\environment*{<name>}[<stuff after>]`

This macro prints the environment name and puts a line break after it. The optional argument allows printing things directly after the environment name and can thus be used for adding arguments.

```

1 \begin{environments}
2   \environment*{foobar}[\oarg{options}]
3   This is environment \env*{foobar}. The star prevents it from being
4   added to the index.
5 \end{environments}

```

```

\begin{foobar}[<options>]
  This is environment foobar. The star prevents it from being added to the index.

```

7.4. Example Code

Example code can be included through the `example` environment or the `sourcecode` environment.

```

1 \begin{example}
2   a \LaTeX\ code example
3 \end{example}

```

This example would give:

```
1 a \LaTeX\ code example
```

a L^AT_EX code example

Both environments can be influenced by options:

code-only = `true|false`

Default: `false`

Only typeset the code as code but don't include it afterwards. The code box above is an example for the usage of this option. This option has no effect on the `sourcecode` environment: this is already what that environment does.

side-by-side = `true|false`

Default: `false`

Typeset source and output side by side. The code is input on the left and the output on the right. Side by side examples are typeset in `minipage` environments with all consequences that come with them (think of `\parindent`, page breaks ...).

code-left = `true|false`

Default: `true`

If `true` and the option **side-by-side** is chosen the source code is printed on the right side else on the left.

code-sep = `{\langle definition \rangle}`

Default: `\hrulefill`

Code that is inserted between a source code and the corresponding output when printed below each other.

The same example again, this time using **side-by-side** (which is the same as using the `sidebyside` environment):

```
1 a \LaTeX\ code example
```

a L^AT_EX code example

side-by-side and **code-left** = `false`:

a L^AT_EX code example

```
1 a \LaTeX\ code example
```

The frame around the examples is done by the `mdframed` package. It is of course possible to customize it:

add-frame-options = `{\langle mdframed options \rangle}`

(initially empty)

Add options to the predefined ones.

frame-options = `{\langle mdframed options \rangle}`

Default: `backgroundcolor=cnltxbg,linecolor=cnltx,roundcorner=5pt`

Overwrite the options with new ones.

8. Formatting Possibilities

The source code is formatted using the listings package. Similar options exist to adapt listings' options that are used for formatting the source code. The predefined style has many options that will not be mentioned here. If you're interested you can find them in `cnltx-csnames.sty` or in section B on page 32.

`gobble` = $\langle integer \rangle$ Default: 2

The number of initial characters that is gobbled from each line.

`add-cmds` = $\{\langle list\ of\ csnames \rangle\}$ (initially empty)

A list of control sequence names that should be recognized as a command sequence in the source code examples and should be formatted accordingly. The control sequence names in this list will also get an index entry when they're used in the source example. This is done internally via `\csidx`. The option should be used to add the new commands that are defined by the package for which you are writing the manual for.

`add-silent-cmds` = $\{\langle list\ of\ csnames \rangle\}$

A list of control sequence names that should be recognized as a command sequence in the source code examples and should be formatted accordingly. The control sequence names in this list will *not* get an index entry when they're used in the source example. There already is quite a large but far from comprehensive list of silent commands but many are still missing. This option allows you to extend the list on a per document basis.

`add-listings-options` = $\{\langle listings\ options \rangle\}$ (initially empty)

Additional options for the listings environments.

`listings-options` = $\{\langle listings\ options \rangle\}$

Overwrite existing options with new ones. This can be used to build an own style from scratch.

`add-envs` = $\{\langle list\ of\ environment\ names \rangle\}$ (initially empty)

Like `add-cmds` but for environment names.

`add-silent-envs` = $\{\langle list\ of\ environment\ names \rangle\}$

Like `add-silent-cmds` but for environment names.

8. Formatting Possibilities

One of the goals I wanted to achieve with this package is a consistent look and an easy interface for customization. No font choice and no color choice is fixed. In this section ways to change the formatting are shown.

The formatting of the different commands provided by `CNLT`X and various other properties can be changed in two ways: either by redefining the internal commands that are used for the formatting or by setting a corresponding option. Both variants are described in the next subsections.

How the colors should be changed is described in section 12 on page 24.

8.1. Formatting by Redefining Hooks

You can change the formatting by redefining the following commands. They're all defined by the **CNLTX-EXAMPLE** package except where indicated differently.

<code>\codefont</code>	Default: <code>\ttfamily</code>
This command is used for all formatting of source code.	
<code>\sourceformat</code>	Default: <code>\codefont\small</code>
Formatting of the listings.	
<code>\exampleformat</code>	(initially empty)
Special formatting of the output of a listing.	
<code>\versionnoteformat</code>	Default: <code>\footnotesize\sffamily\RaggedRight</code>
Formatting of the notes introduced in section 5.2 on page 6.	
<code>\packageformat</code>	Default: <code>\sffamily</code>
The formatting of package names.	
<code>\classformat</code>	Default: <code>\sffamily</code>
The formatting of class names.	
<code>\argumentformat</code>	Default: <code>\normalfont\itshape</code>
The formatting of <code>\meta{⟨meta⟩}</code> .	

provided by the
CNLTX-DOC class

```

1 \renewcommand*\codefont{\sffamily\bfseries}
2 \code{foo} and \cs*{bar}, option \option{baz}

```

foo and **\bar**, option **baz**

8.2. Formatting by Setting Options

You can change the formatting of by setting the following options. They're all defined by the **CNLTX-EXAMPLE** package except where indicated differently.

<code>title-format = {⟨definition⟩}</code>	Default: <code>\bfseries\scshape</code>
Formatting of the document title.	
<code>caption-font = {⟨definition⟩}</code>	Default: <code>\normalfont\small\sffamily</code>
This option only has any effect if you use the option load-preamble , see section 9.4 on page 21 for details on the option.	
<code>caption-label-font = {⟨definition⟩}</code>	Default: <code>\normalfont\small\sffamily\scshape</code>
This option only has any effect if you use the option load-preamble , see section 9.4 on page 21 for details on the option.	

Introduced in
version 0.2

9. Options that are Directly Related to the **CNLTX-DOC** Class

code-font = { \langle definition \rangle } Default: `\ttfamily`

Used for all formatting of source code.

source-format = { \langle definition \rangle } Default: `\codefont\small`

Formatting of the listings.

expl-format = { \langle definition \rangle } (initially empty)

Special formatting of the output of a listing.

version-note-format = { \langle definition \rangle } Default: `\footnotesize\sffamily\RaggedRight`

provided by the **CNLTX-DOC** class
Formatting of the notes introduced in section 5.2 on page 6.

acronym-format = { \langle definition \rangle } Default: `\scshape`

provided by the **CNLTX-TOOLS** package
Formatting of the acronyms as typeset with `\cnltxacronym`.

pkg-format = { \langle definition \rangle } Default: `\sffamily`

The formatting of package names.

cls-format = { \langle definition \rangle } Default: `\sffamily`

The formatting of class names.

arg-format = { \langle definition \rangle } Default: `\normalfont\itshape`

The formatting of `\meta{ \langle meta \rangle }`.

default-format = { \langle code \rangle } Default: `\uline`

Introduced in version 0.2
The formatting of `\default`'s argument. \langle code \rangle 's last macro should take one argument.

```
1 \setcnltx{code-font=\sffamily\itshape}
2 \code{foo} and \cs*{bar}, option \option{baz}
```

foo and `\bar`, option *baz*

9. Options that are Directly Related to the **CNLTX-DOC** Class

9.1. Using Class Options

The **CNLTX-DOC** class only knows a few options:

load-preamble = `true|false` Default: `false`

See section 9.4 on page 21 for details.

load-preamble+ = `true|false` Default: `false`

See section 9.5 on page 21 for details.

9. Options that are Directly Related to the *CNLT*X-DOC Class

`add-index = true|false`

Default: false

See section 9.5 on page 21 for details.

`babel-options = {\langle options \rangle}`

Default: english

Options given to the babel¹⁶ package. This option only has an effect if `load-preamble = true`.

`scrartcl = {\langle options \rangle}`

(initially empty)

Options that are passed to the underlying class scrartcl. *All global options you want to use should be given here.*

9.2. Information on the Described Package or Class

A manual for a package or a class needs some information on the described package like the package name, the version number, the date and so on. This information is given with the following options. They are used to build the title page of the manual.

`package = {\langle package \rangle}`

The name of the package that is described. Either this option or `class` or `name` should always be given. This command also defines a command sequence from the package name that formats the package name with color and small caps like *CNLT*X.

`class = {\langle class \rangle}`

The name of the class that is described. Either this option or `package` or `name` should always be given. This command also defines a command sequence from the class name that formats the class name with color and small caps like *CNLT*X.

`name = {\langle name \rangle}`

The name of the class/package that is described. Either this option or `package` or `class` should always be given. This command also defines a command sequence from the class name that formats the class name with color and small caps like *CNLT*X.

`authors = {\langle author list \rangle}`

Comma separated list of package/class authors.

`version = {\langle version number \rangle}`

Version number of the package/class. *CNLT*X tries to extract the information from the given `package` or `class`. This option can be used to set it explicitly.

`date = {\langle date \rangle}`

Date of the package/class. *CNLT*X tries to extract the information from the given `package` or `class`. This option can be used to set it explicitly.

`info = {\langle package/class info \rangle}`

Information about the package/class. *CNLT*X tries to extract the information from the given `package` or `class`. This option can be used to set it explicitly.

¹⁶. on CTAN as babel: <http://mirrors.ctan.org/macros/latex/required/babel/>

9. Options that are Directly Related to the *CNLTX-DOC* Class

`subtitle = {\<subtitle>}`

A subtitle that is typeset *instead* of the package/class info.

`url = {\<url>}`

The homepage of the package.

`email = {\<email>}`

A contact email address.

`abstract = {\<abstract>}`

An abstract of the package/class/manual. This is text typeset in a box of `.75\linewidth`. Actually it does not have to be text but could be an image or whatever you like.

9.3. Building of the Manuals Title Page

If either the `package` or `class` has been given an automatic title page is built using the gathered information. Figure 1 roughly sketches which informations is used and how the different elements are arranged on the title page. The page style of the title page is `plain`. Additionally a table of contents is automatically built that is set in two columns. The automatic building of the title page can be prevented by explicitly setting the following option:

`build-title = true|false`

The default state depends on other options given like `package`. However, setting this option to `false` *after* any of the options described in section 9.2 on the previous page will prevent the building of a title page and allows you to design your own.

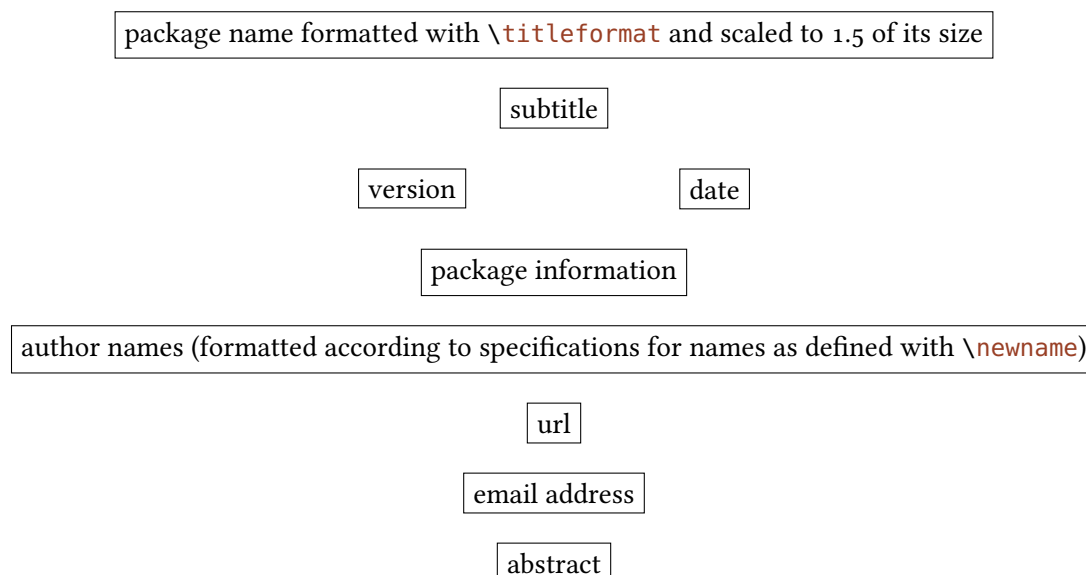

FIGURE 1: Schematic sketch of the title page.

9.4. Predefined Preamble

It is possible to load a part of my standard preamble automatically by passing an option as class option.

load-preamble

Class option that preloads part of my custom preamble.

Using the option will include the following code:

```

1 \RequirePackage[oldstyle]{libertine}
2 % 'libertinehologopatch' is not on CTAN, yet!
3 % you can get it at https://bitbucket.org/cgnieder/libertinehologopatch
4 \RequirePackage{libertinehologopatch}
5 \RequirePackage[supstfm=libertinesups]{superiors}
6 \RequirePackage{microtype}
7 \RequirePackage[scaled=.83]{beramono}
8 \RequirePackage{fnpct}
9 \RequirePackage[english]{babel}
10 \renewcommand*{\othersectionlevelsformat}[3]{%
11   \textcolor{cnltx}{\#3\autodot}\enskip}
12 \renewcommand*{\partformat}{%
13   \textcolor{cnltx}{\partname~\thepart\autodot}}
14 \def\footnote{2em}{1em}{\llap{\thefootnotemark. }}%
15 \pagestyle{headings}
16 \setcapindent{1.5em}
17 \setkomafont{caption}{\cnltx@caption@font}
18 \setkomafont{captionlabel}{\cnltx@captionlabel@font}

```

The effect of this preamble is demonstrated by the document you're reading at this moment.

9.5. Predefined Indexing

*CNLT*X-DOC allows the automated creation of an index. This is done with the help of the *imakeidx* package by Enrico Gregorio. To use this feature you have two class options. They cannot be set with `\setcnltx` but must be given as class options.

`add-index = true|false`

Default: false

Enables the automatic creation of an index at the end of the document.

`load-preamble+ = true|false`

Default: false

This option has the same effect as adding both `load-preamble` and `add-index`.

Enabling the feature

- loads the *imakeidx*¹⁷ package,

¹⁷ on CTAN as *imakeidx*: <http://mirrors.ctan.org/macros/latex/contrib/imakeidx/>

10. Predefined listings and mdframed Styles

- uses a given style file for the index that can be specified with the `index-style` option,
- sets a certain setup for the index that can be specified with the `index-setup` option and
- adds an index at the end of the document.

The following options are available to customize the appearance of the index:

`index-prologue` = $\{\langle text \rangle\}$

Adds $\langle text \rangle$ as index prologue between heading and the actual index.

`index-space` = $\{\langle dimension \rangle\}$

Default: 0pt

The vertical space between index prologue and index.

`index-setup` = $\{\langle options \rangle\}$

Default: `othercode=\footnotesize, level=\section`

The options that are passed to imakeidx's `\indexsetup` command.

`makeindex-setup` = $\{\langle options \rangle\}$

Default: `columns=2, columnsep=1em`

The options that are passed to the `\makeindex` command.

`index-style` = $\{\langle style file \rangle\}$

Default: `cnltx.ist`

The style file that is used for formatting the index.

The index style file `cnltx.ist` contains the following lines:

```
1 heading_prefix "{\bfseries "  
2 heading_suffix "\\hfil}\\nopagebreak\n"  
3 headings_flag 1  
4 delim_0 "\\dotfill"  
5 delim_1 "\\dotfill"  
6 delim_2 "\\dotfill"  
7 delim_r "\\textendash"  
8 delim_t ""  
9 suffix_2p "\\nohyperpage{\\,\\GetTranslation{cnltx-f.}\\@}"  
10 suffix_3p "\\nohyperpage{\\,\\GetTranslation{cnltx-ff.}\\@}"
```

The feature is demonstrated by this document which does not contain a single control sequence containing the string `index`!

10. Predefined listings and mdframed Styles

10.1. mdframed

The source code environments (see section 7.4 on page 14) all get a frame with the help of the `mdframed` package. For this a custom style is defined called `cnltx`. The options `frame-options` and `add-frame-options` mentioned in section 7.4 on page 14 manipulate this style. It is predefined with these values:

```

1 \def\cnltx@mdframed@options
2 {
3   backgroundcolor = cnltxbg ,
4   linecolor       = cnltx ,
5   roundcorner     = 5pt
6 }

```

10.2. listings

The code of the source code environments (see section 7.4 on page 14) is formatted with the help of the listings package. A listings style is defined called cnltx. The options `add-cmds`, `add-silent-cmds`, `add-envs`, `add-silent-envs`, `listings-options` and `add-listings-options` manipulate this style. It is predefined as follows:

```

1 \def\cnltx@listings@style{
2   language       = [LaTeX]TeX,
3   basicstyle      = {\sourceformat},
4   numbers        = left,
5   numberstyle     = \tiny,
6   xleftmargin     = 1em,
7   numbersep       = .5em,
8   gobble          = \cnltx@gobble ,
9   columns         = fullflexible,
10  literate         =
11    {ä}{\{"a}}1
12    {ö}{\{"o}}1
13    {ü}{\{"u}}1
14    {Ä}{\{"A}}1
15    {Ö}{\{"O}}1
16    {Ü}{\{"U}}1
17    {ß}{\{"ss}}1 ,
18  breaklines       = true,
19  keepspaces       = true,
20  breakindent      = 1em,
21  commentstyle     = \color{comment},
22  keywordstyle     = \color{cs},
23  deletetexcs      =
24  {
25    a,o,u,A,O,U,
26    begin,
27    center,
28    description,document,
29    end,enumerate,
30    figure,flushleft,flushright,
31    itemize,

```

```

32     otherlanguage,
33     table, tabu, tabular
34 },
35 % \begin, \end:
36 texcsstyle      = [2]\color{beginend},
37 index           = [2][texcs2],
38 indexstyle      = [2]\@gobble,
39 moretexcs       = [2]{begin,end},
40 % environments:
41 texcsstyle      = [3]\color{env},
42 index           = [3][texcs3],
43 indexstyle      = [3]\@gobble,
44 % control sequences:
45 texcsstyle      = [4]\color{cs},
46 index           = [4][texcs4],
47 indexstyle      = [4]\@gobble ,
48 % added control sequences:
49 texcsstyle      = [5]\color{cs},
50 index           = [5][texcs5],
51 indexstyle      = [5]\indexcs,
52 % added environments:
53 texcsstyle      = [6]\color{env},
54 index           = [6][texcs6],
55 indexstyle      = [6]\envidx,
56 }

```

11. PDF Strings and hyperref

Since the formatting and indexing commands `\cs`, `\env`, `\option`, `\pkg`, `\cls` and `\key` are robust they are ignored in PDF strings. For this reason you should *only use the starred variants* in places where PDF bookmarks are built from such as section titles when you use `hyperref`. Since **CNLTX-DOC** loads `hyperref` this means you should do so, too, when you use **CNLTX-DOC**. This is important for two reasons:

1. Indexing in strings that get written to the table of contents does not make much sense, anyway, so the starred versions should be used in section titles even if you don't use `hyperref`.
2. When `hyperref` is loaded the mentioned commands are disabled in PDF strings in a way that *expects* them to be followed by a star. This means leaving the star out will result in doesn't match its definition errors.

12. Predefined Colors and Color-Schemes

12.1. Explicitly Defined Colors

The **CNLTX-BASE** package defines a number of colors:

`cnltxbrown` Per default used for the control sequences.

`cnltxblue` Unused per default.

`cnltxred` Per default used as base color in various places.

`cnltxgreen` Unused per default.

`cnltxgray` Per default used for formatting comments.

`cnltxyellow` Per default used for options.

`cnltxformalblue` Unused per default.

`cnltxformalred` Unused per default.

12.2. Actual Used Color Names and Color Schemes

The colors defined in section 12.1 on the previous page are not directly used with those names. Instead colors are used whose names describe their function rather than the color. For this the color names are mapped to actual colors and saved as a coloring scheme. There are currently three predefined color schemes whose definitions are given below. Those definitions also show the actually used color names:

The ‘default’ color scheme is defined as follows:

```

1 \cnltx@define@colorscheme{default}{
2   cs          => cnltxbrown , % command sequences
3   option      => cnltxyellow , % options
4   option      => cnltxyellow , % modules
5   comment     => cnltxgray ,  % comments
6   beginend    => red ,        % \begin and \end
7   env         => black ,      % environment names
8   argument    => black ,      % argument delimiters
9   meta        => black!80 ,   % arguments of \meta
10  cnltx        => cnltxred ,   % base color
11  cnltxbg      => white ,      % source code box background
12  link         => black!90 ,   % hyperlinks
13  versionnote  => black!75    % versioning notes text
14 }
```

The ‘blue’ color scheme is defined this way:

```

1 \cnltx@define@colorscheme{blue}{
2   cs          => cnltxbrown ,
3   option      => cnltxgreen ,
4   module      => cnltxred ,
5   comment     => cnltxgray ,
6   beginend    => red ,
```

```

7  env          => black ,
8  argument     => black ,
9  meta         => black!80 ,
10 cnltx        => cnltxblue ,
11 cnltxbg      => yellow!10 ,
12 link         => cnltx ,
13 versionnote  => black!75
14 }

```

Finally the ‘formal’ color scheme is defined like this:

```

1 \cnltx@define@color@scheme{formal}{
2   cs          => black ,
3   option      => cnltxformalblue ,
4   module      => cnltxblue ,
5   comment     => cnltxgray ,
6   beginend    => red ,
7   env         => black ,
8   argument    => black ,
9   meta        => black!80 ,
10  cnltx        => cnltxformalblue ,
11  cnltxbg      => white ,
12  link         => black!90 ,
13  versionnote  => black!75
14 }

```

13. Language Support

Introduced in
version 0.2

The **CNLTX-DOC** and the **CNLTX-EXAMPLE** package both rely on the translations package for providing some document language dependent strings. Currently only translations for English and German are provided. Others can be added and the existing ones changed with the following command provided by the translations package:

\DeclareTranslation{*<language>*}{*<keyword>*}{*<translation>*}

Provide translations for the string identified by the ID *<keyword>*.

The defined strings are listed in table 1 on the following page. They are used in indexing strings and in different parts of the document.

TABLE 1: Overview over available internationalization key words.

Package	key word	English version	German version
CNLTX-EXAMPLE	cnltx-package	package	Paket
CNLTX-EXAMPLE	cnltx-class	class	Klasse
CNLTX-EXAMPLE	cnltx-environment	environment	Umgebung
CNLTX-DOC	cnltx-default	Default	Voreinstellung
CNLTX-DOC	cnltx-empty	initially empty	zunächst leer
CNLTX-DOC	cnltx-required	required	erforderlich
CNLTX-DOC	cnltx-toc	Table of Contents	Inhaltsverzeichnis
CNLTX-DOC	cnltx-license	Permission is granted to copy, distribute and/or modify this software under the terms of the L ^A T _E X Project Public License (LPPL), version 1.3 or later (http://www.latex-project.org/lppl.txt). The software has the status	Es ist erlaubt, diese Software zu kopieren und zu verteilen unter den Bedingungen der L ^A T _E X Project Public License (LPPL), Version 1.3 oder später. (http://www.latex-project.org/lppl.txt). Sie hat den Status
CNLTX-DOC	cnltx-introduced	Introduced in version	Eingeführt in Version
CNLTX-DOC	cnltx-changed	Changed in version	Geändert in Version
CNLTX-DOC	cnltx-f.	f.	f.
CNLTX-DOC	cnltx-ff.	ff.	ff.

Part III.

Appendix

A. Internal Helper Commands

The commands in this section are only described for the sake of completeness. They are not meant to be used in a document.

A.1. Defined by **CNLTX-BASE**

Especially **CNLTX-BASE** defines some useful helper macros that are also used by the other packages and classes.

\cnltx@@date

The creation date of the current version of the bundle.

\cnltx@@version

The version number of the bundle.

\cnltx@@info

The short description of the bundle.

\cnltx@create@message*{ $\langle module \rangle$ }{Error|Warning|WarningNoLine|Info}

Create suiting error and warning messaging commands for the module $\langle module \rangle$. The starred version creates messages for a class the un-starred version messages for a package.

\cnltx@base@error{ $\langle message \rangle$ }

Issue an error message using **\PackageError**{cnltx-base}.

\cnltx@base@warning{ $\langle message \rangle$ }

Issue a warning message using **\PackageWarning**{cnltx-base}.

\cnltx@base@warningnoline{ $\langle message \rangle$ }

Issue a warning message using **\PackageWarningNoLine**{cnltx-base}.

\cnltx@base@info{ $\langle message \rangle$ }

Issue a message using **\PackageInfo**{cnltx-base}.

\cnltx@par

Expands to **\par**. Sometimes you need to smuggle a **\par** in a short macro ...

\cnltx@ifsym{ $\langle token \rangle$ }{ $\langle true \rangle$ }{ $\langle false \rangle$ }

A generic version of L^AT_EX's **\@ifstar** that checks if $\langle token \rangle$ follows if the input stream. If yes it is removed and $\langle true \rangle$ is placed in the input stream else $\langle false \rangle$.

\cnltx@ifdash{ $\langle true \rangle$ }{ $\langle false \rangle$ }

A wrapper for **\cnltx@ifsym**{-}.

\cnltx@ifbang{ $\langle true \rangle$ }{ $\langle false \rangle$ }

A wrapper for **\cnltx@ifsym**{!}.

\cnltx@expand@arg{ $\langle cs \rangle$ }{ $\langle macro \rangle$ }

Expands $\langle macro \rangle$ once before it is passed as argument to $\langle cs \rangle$.

\cnltx@fullexpand@arg{ $\langle cs \rangle$ }{ $\langle argument \rangle$ }

Exhaustive expansion of $\langle argument \rangle$ before it is passed as argument to $\langle cs \rangle$.

Changed in
version 0.2

Introduced in
version 0.3

A. Internal Helper Commands

`\cnltx@fullexpand@twoargs{<cs>}{<argument1>}{<argument2>}`

Exhaustive expansion of `<argument1>` and `<argument2>` before they're passed as argument to `<cs>`. This is an alias of the kernel command `\@expandtwoargs` defined for the sake of consistency.

`\cnltx@stripbs`

A shortcut for `\expandafter\@gobble\string`.

`\cnltx@if@in{<tokenlist>}{<search>}{<true>}{<false>}`

Places `<true>` in the input stream if `<search>` is found in `<tokenlist>` and `<false>` if it isn't.

`\cnltx@replace@once{<cs>}{<search>}{<replace>}`

Replaces the first occurrence of `<search>` in the first expansion of `<cs>` with `<replace>`.

`\cnltx@long@replace@once{<cs>}{<search>}{<replace>}`

Introduced in
version 0.3

The same as `\cnltx@replace@once` but `<cs>` will be redefined with `\long`.

`\cnltx@replace@all{<cs>}{<search>}{<replace>}`

Replaces all occurrences of `<search>` in the first expansion of `<cs>` with `<replace>`.

`\cnltx@long@replace@all{<cs>}{<search>}{<replace>}`

Introduced in
version 0.3

The same as `\cnltx@replace@all` but `<cs>` will be redefined with `\long`.

`\cnltx@remove@once{<cs>}{<search>}`

Introduced in
version 0.3

Removes the first occurrence of `<search>` in the first expansion of `<cs>`.

`\cnltx@long@remove@once{<cs>}{<search>}`

Introduced in
version 0.3

The same as `\cnltx@remove@once` but `<cs>` will be redefined with `\long`.

`\cnltx@remove@all{<cs>}{<search>}`

Introduced in
version 0.3

Removes all occurrences of `<search>` in the first expansion of `<cs>`.

`\cnltx@long@remove@all{<cs>}{<search>}`

Introduced in
version 0.3

The same as `\cnltx@remove@all` but `<cs>` will be redefined with `\long`.

`\cnltx@define@colorscheme{<name>}{<scheme definition>}`

Command that can be used to define a color scheme.

A.2. Defined by CNLTX-EXAMPLE

`\cnltx@example@error{<message>}`

Issue an error message using `\PackageError{cnltx-example}`.

`\cnltx@example@warning{<message>}`

Issue a warning message using `\PackageWarning{cnltx-example}`.

`\cnltx@example@warningnoline{<message>}`

Issue a warning message using `\PackageWarningNoLine{cnltx-example}`.

A. Internal Helper Commands

`\cnltx@example@info{<message>}`

Issue a message using `\PackageInfo{cnltx-example}`.

`\cnltxat`

Robust command that typesets ‘@’ with category code 11. An @ in command names confuses the indexing of the command names. Either one uses another symbol for makeindex’s “actual” recognition and also tells idxcmds about it or one uses `\cnltxat` in `\cs` and friends. For the sake of convenience you can define a command like `\at` that expands to it.¹⁸ In order not to overwrite any such existing macro it is not defined by `CNLTX-EXAMPLE`. This document for example defines `\def\at{\cnltxat}`.

`\cnltxletterat`

An alias of `\cnltxat`.

`\cnltxotherat`

The same as `\cnltxat` but with a ‘@’ with category code 12.

`\cnltxbang`

The same as `\cnltxotherat` except that it contains a ‘!’.

`\cnltxequal`

The same as `\cnltxotherat` except that it contains a ‘=’.

`\cnltx@isvalue`

Used in definitions of the key/value option typesetting commands. Inserts a = with some stretchable space around and a legal break-point after it.

`\indexcs`

Version of `\csidx` that takes care of a `\textcompwordmark` inserted by listings. Also replaces all occurrences of @ with category code 11 or 12 with `\cnltxat`. Used to index commands in the sourcecode and example environments that have been added with `add-cmds`.

`\newarg[<arg formatting>]{<cs>}{<left delim>}{<right delim>}`

Default: `\meta`

Command used to define the argument commands: `\newarg\marg{\}{\}`. The optional argument determines how the argument of the new command will be formatted. This is done with `\meta` per default. `\newarg[\code]\Marg{\}{\}`

`\MakePercentComment`

Sets the category code of % to 14.

`\cnltx@copyablespace`

Prints a space that is also copyable. Uses the `accsupp` package by Heiko Oberdiek.

`\cnltx@mdframed@options`

Predefined option list for the `mdframed` style `cnltx`.

¹⁸. This is important. If you `\let` it to `\cnltxat` index entries may be sorted differently! Remember: `\cnltxat` is robust.

`\cnltx@listings@style`

Predefined option list for the listings style `cnltx`.

A.3. Defined by **CNLTX-TOOLS**

`\cnltx@tools@error{⟨message⟩}`

Issue an error message using `\PackageError{cnltx-tools}`.

`\cnltx@tools@warning{⟨message⟩}`

Issue a warning message using `\PackageWarning{cnltx-tools}`.

`\cnltx@tools@warningnoline{⟨message⟩}`

Issue a warning message using `\PackageWarningNoLine{cnltx-tools}`.

`\cnltx@tools@info{⟨message⟩}`

Issue a message using `\PackageInfo{cnltx-tools}`.

`\cnltx@accsupp{⟨actual text⟩}{⟨additional options⟩}{⟨TEX text⟩}`

A wrapper for package `accsupp`'s `\BeginAccSupp{ActualText = ⟨actual text⟩} ⟨TEX text⟩`
`\EndAccSupp{}`.

A.4. Defined by **CNLTX-DOC**

`\cnltx@doc@error{⟨message⟩}`

Issue an error message using `\ClassError{cnltx-doc}`.

`\cnltx@doc@warning{⟨message⟩}`

Issue a warning message using `\ClassWarning{cnltx-doc}`.

`\cnltx@doc@warningnoline{⟨message⟩}`

Issue a warning message using `\ClassWarningNoLine{cnltx-doc}`.

`\cnltx@doc@info{⟨message⟩}`

Issue a message using `\ClassInfo{cnltx-doc}`.

`\cnltx@getfileinfo{⟨file name⟩}{⟨file extension⟩}`

Extract the date, version and background information for a package or a class.

`\cnltx@version@note{⟨note⟩}`

Command that is used for the versioning notes internally. Sets `\reversemarginpar` and then writes the note `⟨note⟩` to the margin with corresponding formatting.

`\begin{cnltxlist}`

The list environment that is used by the environments commands, options and environments.

A.5. Defined by CNLTX-CSNAMES

`\cnltx@predefined@control@sequences`

A comma-separated list of predefined ‘silent’ control sequence names.

`\cnltx@predefined@environments`

A comma-separated list of predefined ‘silent’ environment names.

`\listsilentcmds`

Prints all known control sequence names formatted and separated with a comma.

`\listsilentenvs`

Prints all known environment names formatted and separated with a comma.

B. List of Known L^AT_EX Control Sequences

Below are listed all *predefined* control sequence names that are treated as “silent” names by **CNLTX**, that is, those defined by **CNLTX-CSNAMES**. You may notice that the list does not cover all control sequences that are formatted. That is because listings already has a number of known control sequence names. This list probably overlaps with those on some parts, though.

<code>\-, \@, \@empty, \@gobble,</code>	<code>\deffootnotemark,</code>	<code>\labelenumiii,</code>
<code>\@ifnextchar, \@ifstar,</code>	<code>\definecolor,</code>	<code>\labelenumiv, \label,</code>
